Our team consists of Jeffrey Chen, Dennis Zhu, and Charlotte Ma. We plan to work collaboratively throughout the project and make sure that the workload is divided as evenly as possible.

For Milestone 1, Jeffrey will focus mainly on the ERD and database structure, including entities, attributes, primary keys, foreign keys, and normalization. Dennis will focus on the draft analysis report, including the project scenario, proposed schema, and assumptions about the data. Charlotte will focus on organizing the GitHub repository, writing the team statement, and reviewing the final materials for consistency and completeness.

Even though each member has a main area of responsibility, we do not plan to work completely separately. We will meet in person to work on the project together, especially when making major decisions about the database structure, relationships, and assumptions. This will help make sure that everyone understands the full project rather than only their individual section.

To keep the workload balanced, we will review each other's work before submitting each milestone. If one member finishes their assigned task earlier or another section requires more work than expected, we will redistribute tasks as needed. We will also use the shared GitHub repository to keep track of updates and make sure that all members contribute to the project.

Our goal is to maintain clear communication, shared responsibility, and equal participation throughout the project. By working together in person and reviewing each other's work, we hope to prevent an uneven workload and make sure that all team members understand and support the final database design.
